Sample project

Build a mobile application where users can search for a GitHub user and display a list of search results.

Requirements

- Use what you have learned during the internship program (UI, Architecture, APIs, Git, etc.).
- Kotlin is mandatory for Android, Swift for iOS, and JavaScript or TypeScript for React Native.
- Use Jetpack Compose for Android and SwiftUI for iOS.
- Use the GitHub Search Users API to fetch data.
  API Endpoint: https://api.github.com/search/users?q={user}&page=1
- Display the user ID, profile picture, and any additional fields of your choice.
- When clicking on a search result, navigate to a details screen and display user details.
  Use the GitHub User Details API.
  API Endpoint: https://api.github.com/users/{username}
- Feel free to use any third-party libraries.
- Upload the project to GitHub or any similar repository manager.

Optional

- Load more search results when scrolling to the end of the list (pagination).
- Save the last search results locally and display them when the application is reopened.
- Add unit tests to the application.
